

Apply filters to SQL queries

Project description

When working with SQL queries, incorporating filters can significantly enhance the precision of your results. For instance, if you need to pinpoint failed login attempts within a large dataset, the use of filters allows you to isolate and display only the relevant failed attempts, making it easier to analyze and address the issue at hand.

Retrieve after hours failed login attempts

I need to retrieve the failed login attempts after 6 PM so I used the `SELECT * FROM login_attempts WHERE login_time > '18:00' AND success = 0;` now using this query you can see in the screenshot below that it only shows failed attempts from 6:01 PM until 12:00 AM. In the success column, you can see all are 0's because MySQL stores Boolean values as 1 for TRUE and 0 for FALSE. This means that TRUE is represented as 1, and FALSE is represented as 0 in the success column.

```
MariaDB [organization]> SELECT * FROM log_in_attempts WHERE login_time > '18:00' AND success = 0;
```

Retrieve login attempts on specific dates

When retrieving login attempts specifically you need to use the OR in your query like the one I used in my query `SELECT * FROM log_in_attempts WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';`. Using that query the system will show you only specific dates on which you specify like in my query which is 2022-05-09 and 2022-05-08.

```
MariaDB [organization]> SELECT *
->
-> FROM log_in_attempts
->
-> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
```

Retrieve login attempts outside of Mexico

When you need to retrieve login attempts that are not from Mexico, you can use the "NOT" keyword in your query, just like I did with the following statement: `SELECT * FROM log_in_attempts WHERE NOT country LIKE 'MEX%';` This query will retrieve all login attempts that do not have a country starting with "MEX." In the screenshot provided, you can see that the country column does not include any entries for Mexico, demonstrating that it has been successfully filtered out.

```
MariaDB [organization]> SELECT *  
->  
-> FROM log_in_attempts  
->  
-> WHERE NOT country LIKE 'MEX%';
```

Retrieve employees in Marketing

In my query, I utilized the "AND" operator to extract precise data from the employee's table. This allowed me to specifically target employees whose department is Marketing and whose office is located in the east. `SELECT * FROM employees WHERE department =`

`'Marketing' AND office LIKE 'EAST%';`

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Marketing' AND office LIKE 'East%';
```

employee_id	device_id	username	department	office
1000	a320b137c219	elarson	Marketing	East-170

7 rows in set (0.002 sec)

Retrieve employees in Finance or Sales

When you use the OR keyword in your query, it enables the display of results that meet either of the specified conditions. For instance, if you indicate "Finance" or "Sales" as the department, the query will return results related to both departments.

```
MariaDB [organization]> SELECT * FROM employees WHERE department = 'Finance' OR department = 'Sales';
```

employee_id	device_id	username	department	office

Summary

Utilizing filters in SQL queries plays a crucial role in refining result accuracy and facilitating detailed analysis and issue resolution. The application of filters enables the extraction of specific data, such as failed login attempts after particular times, login attempts on specific dates, login attempts from particular locations, and employees based on department and office location.

By incorporating the "AND" and "OR" operators, as well as the "NOT" keyword, multiple conditions can be effectively applied to the queries, resulting in the precise retrieval of desired data.
