

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

- Password Policies
- Multifactor Authentication (MFA)
- Firewall Maintenance

Part 2: Explain your recommendations

The employees are sharing passwords since there is no password policies that are implemented. Multifactor Authentication for better security when logging in even if the password is default but if it's multifactor authentication it won't be a problem but better to change it as well. Lastly, Firewall Maintenance since there are no rules in place to filter traffic all the data going in or out is not filtered.
